(54) Title: METHOD OF PRODUCING FLUIDS FROM AN UNDERGROUND RESERVOIR

(57) Abstract

A method is disclosed for producing fluids such as oil and gas from a wellbore, typically a subsea wellbore. The method comprises linking first and second wellbores to enable reservoir fluids located in a reservoir into which the second wellbore passes to reach both wellbores in order to avoid the need for surface pipelines linking the two wells.

1 METHOD OF PRODUCING FLUIDS FROM AN UNDERGROUND RESERVOIR

2

3 The present invention relates to a method of producing
4 fluids from underground reservoirs, and particularly
5 relates to using first and second wellbores to link
6 such reservoirs to a production facility.

7

8 Hydrocarbon reservoirs of oil and gas which are located
9 too far from existing or proposed hydrocarbon
10 production facilities are typically developed by
11 drilling wells from directly above those reservoirs,
12 and then providing a pipeline from the wellhead to the
13 production facility.

14

15 According to the invention there is provided a method
16 of producing fluids from underground reservoirs, the
17 method comprising drilling a first wellbore, drilling a
18 second wellbore into the reservoir, and linking the two
19 wellbores to allow fluids to flow from the reservoir to
20 the first wellbore.

21

22 Preferably the reservoir is an oil or gas well
23 reservoir, and most preferably an offshore reservoir.

24

25 The first wellbore is typically at least partially

1 deviated, so that it extends from a site of a
2 production platform (or similar facility) laterally
3 towards the reservoir for the maximum distance feasible
4 for horizontal or lateral drilling.

5
6 The second wellbore can optionally be drilled
7 subsequently so as to pass through (or close to) the
8 end of the first wellbore and can be vertical or
9 deviated as required to connect the reservoir to the
10 first wellbore.

11

12 The first and second wellbores can be linked by a
13 number of means. For example, the second wellbore can
14 simply pass through the first wellbore, and can be
15 plugged between the junction with the first wellbore
16 and the surface, so that fluids passing through the
17 second wellbore from the reservoir are diverted only
18 into the first wellbore. Alternatively, the first and
19 second wellbores can be linked by a further wellbore
20 drilled before or after the second wellbore, or a
21 series of such further bores, so that the fluids can
22 travel from the reservoir to the first bore through a
23 series of interconnected bores. The first and second
24 (and/or the further) bores can be drilled so as to be
25 separated from one another by a portion of the medium
26 through which they are drilled (ie they can pass close
27 to the ends of the previous bore but not connected
28 thereto to allow fluid flow) and can be linked
29 subsequently by controlled explosion at the ends of the
30 bores, by perforation by some other means, by
31 fracturing, by stimulation, or by drilling etc.
32 Indeed, in one embodiment of the invention it is an
33 option to generate an explosion at the end of the first
34 (or subsequent further) bore in order to create a
35 chamber of a size large enough to facilitate drilling
36 into the chamber when the subsequent wellbore is

1 drilled. Alternatively, where the formation permits,
2 first or subsequent further wellbores can be drilled
3 deliberately into naturally occurring voids (ie
4 formations capable of permitting fluid flow through
5 such formations), so as to allow easy interconnection
6 of the chain of wellbores.

7
8 One advantage of the invention is that pipelines
9 necessary to connect remote wellheads to production
10 facilities can be avoided and this avoids expense in
11 constructing, maintaining, operating and inspecting the
12 pipeline and associated injection pipelines and control
13 umbilicals etc. In addition to cost benefits, the
14 invention allows a decrease in the hydrocarbon-bearing
15 installations above land or above the seabed, thereby
16 reducing potential environmental and safety impacts.

17
18 This invention is therefore particularly applicable in
19 environmentally sensitive areas such as Alaska.

20
21 An embodiment of the present invention will now be
22 described with reference to the accompanying drawings
23 in which:-

24
25 Fig.1 is a schematic representation of a system of
26 wells drilled according to the present invention;

27 and

28 Fig. 2 is a schematic representation of a system
29 of wells drilled according to a second embodiment.

30

31 Referring now to the drawings, Fig. 1 shows a fixed
32 drilling/production platform P having a vertical well
33 connecting the platform to two hydrocarbon reservoirs
34 R1, R2 directly below the platform P. The platform P
35 is also drilling, by conventional, known means, a
36 laterally deviated well W1 in the direction of a third

1 hydrocarbon reservoir R3 laterally displaced from the
2 production platform P. When the limit of horizontal
3 drilling of well W1 is reached, a second well W2 is
4 drilled from a semi-submersible (or fixed jacket or any
5 other drilling facility) drilling platform D1 downwards
6 from the platform D1 in the direction of the end point
7 of well W1. W2 can be drilled straight through a
8 portion of W1, for example at the end thereof, or can
9 be drilled so as to pass close to the end of W1, but
10 not to intersect with it to allow fluid flow between W2
11 and W1. In the embodiment shown in Fig. 1, the well W2
12 has been drilled to intersect with W1 and allow fluid
13 transfer between the wellbores.

14
15 After intersecting or passing close to W1, the second
16 well W2 is drilled laterally as W2L towards the third
17 hydrocarbon reservoir R3. When W2L reaches the
18 formation of hydrocarbon reservoir R3, the drilling
19 string extracted and the wells completed, a plug P5 can
20 be inserted in W2 between the junction with W1 and the
21 platform D1 so as to divert fluids flowing from
22 reservoir R3 into W1 and therefore to the production
23 platform P. The platform D1 is then no longer
24 required.

25
26 The junction between W2 and W1 (Detail A) can be made
27 during drilling by accurately drilling W2 into W1 using
28 directional drilling techniques. W2 can be drilled
29 subsequently to W1, or vice versa. Alternatively, W1
30 can be drilled into an existing and depleted
31 hydrocarbon reservoir or other naturally occurring void
32 from a lateral side thereof, and W2 can subsequently be
33 drilled into the same depleted reservoir and on through
34 it into reservoir R3. As a further alternative, the
35 two wells can be drilled so as not to intersect but to
36 pass within a short distance (eg a few metres) of one

1 another allowing perforation of the separation by eg
2 explosives etc. at a later date when drilling has been
3 completed. It can be seen from this embodiment that
4 the order of drilling W1 and W2 does not matter.

5

6 Fig. 2 shows a further embodiment of the invention
7 similar to that shown in Fig. 1 except that W2L is
8 drilled into a natural occurring cavity (Detail B) at
9 the limit of horizontal drilling of W2L. A third well
10 W3 is drilled (before or after W1 and W2) to intersect
11 with cavity (Detail B) and to extend thereto to
12 reservoir R4. As in the first embodiment, a plug P5
13 can be installed upon completion of W3 to divert fluids
14 from R4 into W2L and from there into W1. As before,
15 the manner and timing of linkage from W3 to W2L is a
16 matter of choice, and can be by eg explosives etc.

17

18 According to the invention, any number of wells can be
19 linked together in order to tie distant reservoirs to
20 existing or proposed platforms by boreholes rather than
21 by pipelines. The same drill ship or platform D1 can
22 be used to drill the second and further wells linking
23 the first wellbore to the reservoir, and more than one
24 wellbore can be drilled from any one drill ship so as
25 to allow several branches leading back to the same
26 first or subsequent lateral well, as shown in the
27 dotted lines of wells W5 and W6 connecting reservoirs
28 R5 and R6 respectively to the cavity at Detail B.
29 Although described with specific examples relating to
30 offshore drilling facilities, the invention is also
31 applicable to onshore wells, and the drill
32 ships/offshore platforms described in the examples can
33 be replaced by onshore equivalents well known in the
34 art.

35

36 The wellbore sizes can be varied according to

1 production requirements.

2

3 Should pigging facilities, chemical injection
4 facilities etc be required then the design of the
5 wellbores can be altered to facilitate the
6 incorporation of such facilities eg subsurface pigging
7 facilities from W2 to W1 and to platform P.

8

9 Modifications and improvements can be incorporated
10 without departing from the scope of the invention. For
11 example, although described with regard to hydrocarbon
12 reservoirs of oil and/or gas, the invention is
13 applicable to water and gas injection wells, and to
14 wells for the production and recovery of other liquids
15 gases, or slurries.

16

1 Claims

2

3 1 A method of producing fluids from an underground
4 reservoir, the method comprising drilling a first
5 wellbore, drilling a second wellbore into the
6 reservoir, and linking the two wellbores to allow
7 fluids to flow from the reservoir to the first
8 wellbore.

9

10 2 A method as claimed in claim 1, wherein the first
11 wellbore is deviated.

12

13 3 A method as claimed in claim 1 or claim 2, wherein
14 the wellbores are linked by drilling.

15

16 4 A method as claimed in any preceding claim,
17 wherein the reservoir is of oil or gas.

18

19 5 A method as claimed in any preceding claim,
20 wherein the wellbores are offshore or onshore
21 wellbores.

22

23 6 A method as claimed in any preceding claim,
24 wherein the first wellbore extends from a site of a
25 production platform towards the reservoir for the
26 maximum distance feasible for lateral drilling.

27

28 7 A method as claimed in any preceding claim,
29 wherein the second wellbore is drilled after the first
30 wellbore.

31

32 8 A method as claimed in any preceding claim,
33 wherein the second wellbore passes through or close to
34 the end of the first wellbore.

35

36 9 A method as claimed in any preceding claim,

1 wherein the second wellbore is deviated.

2

3 10 A method as claimed in any preceding claim,
4 wherein the second wellbore passes through or close to
5 the first wellbore.

6

7 11 A method as claimed in any one of claims 1-9,
8 wherein the first and second bores are drilled so as to
9 be separated from one another by a portion of the
10 medium through which they are drilled and are linked
11 subsequently by removal of the separating portion.

12

13 12 A method as claimed in claim 11, wherein the
14 separating portion is removed by perforation,
15 explosion, fracturing, stimulation or by drilling.

16

17 13 A method as claimed in any preceding claim,
18 wherein an explosion is detonated at the end of a bore
19 in order to create a chamber into which the successive
20 bore can be drilled.

21

22 14 A method as claimed in any preceding claim,
23 wherein a bore is drilled into naturally occurring
24 voids in the medium, into which a successive bore is
25 drilled.

26

27 15 A method as claimed in any preceding claim,
28 wherein after the two bores are linked the second
29 wellbore is plugged between the junction with the first
30 wellbore and the surface so that fluids passing through
31 the second wellbore from the reservoir are diverted
32 into the first wellbore.

33

34 16 A method as claimed in any preceding claim,
35 wherein the first and second wellbores are linked by
36 one or more further wellbore(s) drilled before or after

1 the second wellbore:

2

3 17 A method as claimed in claim 16, wherein the
4 reservoir(s) is linked to a production platform by
5 means of a linked chain of connected wellbores.
